

Formal definition of limit. We write $\lim_{x \rightarrow a} f(x) = L$ if for every number $\epsilon > 0$ there is a number $\delta > 0$ such that if $0 < |x - a| < \delta$ then $|f(x) - L| < \epsilon$.

1. Find a number $\delta > 0$ such that if $|x - 3| < \delta$ then $|3x - 9| < 1$. Find a (possibly different) number $\delta > 0$ such that if $|x - 3| < \delta$ then $|3x - 9| < 0.09$.

$$\begin{array}{l}
 |3x - 9| < 1 \iff 3|x - 3| < 1 \\
 \iff |x - 3| < \frac{1}{3}. \\
 \\
 \text{So if } \delta = \frac{1}{3}, \text{ then} \\
 |x - 3| < \delta \text{ implies } |3x - 9| < 1.
 \end{array}
 \left|
 \begin{array}{l}
 |3x - 9| < 0.09 \iff 3|x - 3| < 0.09 \\
 \iff |x - 3| < 0.03. \\
 \\
 \text{So if } \delta = 0.03, \text{ then} \\
 |x - 3| < \delta \text{ implies } |3x - 9| < 0.09.
 \end{array}
 \right.$$

2. Using the formal definition of limit, prove the following:

(a) $\lim_{x \rightarrow 3} 3x = 9$

Let $\epsilon > 0$ be given.

$$\begin{aligned}
 |3x - 9| < \epsilon &\iff 3|x - 3| < \epsilon \\
 &\iff |x - 3| < \frac{\epsilon}{3}.
 \end{aligned}$$

So if $\delta = \frac{\epsilon}{3}$, then $|x - 3| < \delta$ implies $|3x - 9| < \epsilon$.

(b) $\lim_{x \rightarrow -3} 6x + 7 = -11$

Let $\epsilon > 0$ be given.

$$\begin{aligned}
 |6x + 7 - (-11)| < \epsilon &\iff 6|x + 3| < \epsilon \\
 &\iff |x + 3| < \frac{\epsilon}{6}.
 \end{aligned}$$

So if $\delta = \frac{\epsilon}{6}$, then $|x - (-3)| < \delta$ implies $|6x + 7 - (-11)| < \epsilon$.

(c) $\lim_{u \rightarrow 0} \sin u = 0$ (hint: $|\sin u| \leq |u|$ for all numbers u)

Let $\epsilon > 0$ be given.

$$|\sin u - 0| = |\sin u| \leq |u|, \text{ so if } \delta = \epsilon,$$

then $|u - 0| < \delta$ implies $|\sin u - 0| < \epsilon$.

3. Consider the function $f(x) = x^3$.

(a) Determine $\lim_{x \rightarrow 0} f(x)$ and sketch the graph of f .

(b) Let $\epsilon = 2$ and use your graph from (a) to find a number $\delta > 0$ such that $0 < |x| < \delta$ implies $|f(x)| < \epsilon$.

(c) Repeat part (b) with $\epsilon = 1$. If you were to repeat (b) for an *arbitrary* $\epsilon > 0$, what δ would you choose?

4. Challenge: Prove that $\lim_{x \rightarrow 1} x^2 = 1$. (Hint: If $|x - 1| < \delta$, then how large can $|x + 1|$ be?)
